

Copilot Chat for Learning Support — one page

Print it. Pin it above the desk.

BEFORE YOU TYPE: WHICH COPILOT ARE YOU IN?

School account → enterprise data protection. Prompts stay in your organisation's tenant, not used to train the model. Look for the protection indicator by the prompt box. **This is the only one to use for work.**

Personal account or logged out → treat every word as public. Don't send something you wouldn't write in an email to all parents school-wide.

Protected ≠ permitted. Protection governs where data travels. It does not grant permission to put student information in. In a NSW public school that permission is governed by **PPIPA**, by **HRIPA** for anything originating with a psychologist, OT, speech pathologist or paediatrician, and by your school's own AI-use policy — all unchanged by Copilot's arrival. (Non-government and IB schools sit under the federal Privacy Act and the APPs instead. Same discipline, different instrument.) Unsure? Ask your privacy or IT lead *before*.

Check your school's current AI-use policy and approved-tool list before you rely on any of this — both of them change.

BRAKE 1 — DE-IDENTIFY

INSTEAD OF	TYPE THIS
"Jayden really struggles with..."	"A Year 5 student who struggles with..."
"His psych report says working memory 4th percentile"	"Assessed with significant working memory difficulty"
Pasting the ILP straight in	Typing the three goals in your own words, no name
"Room 12, in Ms Patel's class"	"A mainstream Year 5 class with one TA"
A photo of the worksheet with a name in the header	Retyping the task text on its own

The train test: print the prompt, leave it on a train — is anyone identifiable? Year level + condition + class + suburb together are enough. De-identification is a *combination* test, not a name test.

BRAKE 2 — CHECK THE C.O.R.E.

	EXAMPLE
C Context — who you are, who the learner is, the setting. Never a name.	"I'm a learning support teacher. Year 8 student, decoding at roughly Year 3 level, mainstream science, one TA."
O Objective & output — what you want, and the exact shape it comes back in.	"Rewrite the passage so they can access it independently. Give it to me as a two-column table."
R Role & rules — who it's being, and the limits it has to hold.	"You're an experienced LS teacher. Keep all six key terms, max 200 words, don't simplify the science."
E Evaluation & examples — one example of good, and how you'll judge what comes back.	"Match the tone of this line: [...]. Then flag any term that still needs pre-teaching."

Four lines, about forty seconds. Turns a 60% answer into a 90% one — and 90% is something you can edit instead of rewrite.

If you only remember two letters, make them R and E. Assigning a role and giving one worked example are the two techniques that move the answer most, and they're the two nearly everyone skips. **C is where the privacy discipline lives** — "never a name" is part of the scaffold, not a separate rule to remember afterwards.

BRAKE 3 — THE THREE-POINT CHECK, ON THE OUTPUT

- Is it true?** Every strategy, statistic, criterion or citation gets checked against something you'd cite in a meeting. Can't verify it? Cut it.
- Is it mine?** Would I have written this? If it isn't the call you'd have made, it doesn't go in. Rewrite in your own voice — especially anything formal or parent-facing.
- Is anyone identifiable?** Check the *output*, not just what you typed. It will invent a student name and you'll paste it into a real document at 4:40pm.

THE RED LINES — NO PROMPT MAKES THESE OKAY

- × Real names, dates of birth, addresses, photos, student ID numbers

- × Psychology, OT, speech, paediatric or medical reports — no excerpts, no screenshots, no "just this one bit"
- × A diagnosis attached to anything that could identify the child
- × Full ILPs, PLPs, NCCD evidence, case-meeting minutes or parent emails pasted verbatim
- × Anything touching a child protection or safeguarding matter. Ever. Not even de-identified.
- × Letting the model make the call on a diagnosis, adjustment, placement or funding claim
- × Pasting AI text into a formal document without rewriting it as your own professional judgement
- × Report comments or assessment judgements submitted as your own. NESA and the IB both require the judgement to be yours.

If you catch yourself typing "*is it okay if I just...*" — the answer is no. Ask your privacy or IT lead. That conversation takes two minutes.

NCCD, AND WHY DE-IDENTIFYING DOESN'T COST YOU EVIDENCE

What NCCD records is **the adjustment you made and your professional judgement of it** — not the tool you used to draft the wording. De-identified drafting is entirely compatible with it. The evidence that goes on file has to be your own words and your own decision, and the student's identifying details belong in your school's system, never in a chat window. Drafting with AI does not weaken NCCD evidence. Outsourcing the judgement does.

WHEN IT'S ALREADY GONE WRONG

You typed a real name. Here's the next ten minutes.

- Stop.** Don't send another prompt in that thread trying to talk your way out of it.
- Screenshot the thread,** then write down what you entered and roughly when.
- Do not quietly delete it and hope.** Deleting destroys your evidence, not the record.
- Tell your principal or the school's privacy contact today.** Whether it's a notifiable breach is their call to make, not yours.

Reporting it the same day is a small conversation. Finding out six weeks later is not.

SIX LOADS WORTH LIFTING

- Reading-age rewrites** — same content, lower reading age, subject vocabulary intact
- Tiered tasks** — one worksheet, three levels
- Scaffolds on demand** — sentence starters, cloze, word banks, step sequences
- ILP / PLP drafting** — your bullet points into SMART wording (you set the goal)
- Plain-language comms** — dense paragraph → something a parent can read
- Long-document triage** — 40-page policy cut down to what touches your caseload

THE CRASH-TEST PROMPT (COPY THIS ONE)

"You're a Year 7 student with weak working memory and slow processing. Below is a task I've written. Work through it step by step as that student and tell me the exact points where you'd get stuck, give up, or need to re-read. Don't fix it yet — just show me where it breaks."

Then, and only then:

"Now suggest three adjustments, ranked by how little they change the task for everyone else."

No student data required. You keep the decision.

The baby is a genius. The forklift is genuinely powerful. You are the only qualified adult in the warehouse.
